

Taylor 公式:

一元函数: $y=f(x)$, $x \in x_0$:

$$f(x) = f(x_0) + f'(x_0)(x-x_0) + \frac{1}{2!} f''(x_0)(x-x_0)^2 + \dots + \frac{1}{n!} f^{(n)}(x_0)(x-x_0)^n \\ + \frac{f^{(n+1)}(\xi)}{(n+1)!} (x-x_0)^{n+1}$$

ξ 介于 x_0 与 x 之间 $[\xi]$.

$\xi = x_0 + \theta(x-x_0)$, $0 < \theta = \frac{\xi-x_0}{x-x_0} < 1$

二元函数 $f(x, y)$ 在 (x_0, y_0) : $x-x_0 \triangleq h$, $y-y_0 \triangleq k$:

$$f(x, y) = f(x_0, y_0) + \underbrace{f_x(x_0, y_0)h + f_y(x_0, y_0)k}_{\rightarrow \nabla f(x_0, y_0) \cdot (h, k)} \\ + \frac{1}{2!} (h\partial_x + k\partial_y)^2 f(x_0, y_0) \leftarrow = (h\partial_x + k\partial_y) f(x_0, y_0) \\ \vdots \\ + \frac{1}{n!} (h\partial_x + k\partial_y)^n f(x_0, y_0) \leftarrow \frac{1}{2!} (h, k) H \begin{pmatrix} h \\ k \end{pmatrix} \\ + \frac{1}{(n+1)!} (h\partial_x + k\partial_y)^{n+1} f(x_0 + \theta h, y_0 + \theta k)$$

$H = \begin{pmatrix} f_{xx} & f_{xy} \\ f_{xy} & f_{yy} \end{pmatrix} \Big|_{(x_0, y_0)}$

$0 < \theta < 1$ ——— Taylor 公式

记号: $\rho = \sqrt{h^2 + k^2} = \|(h, k)\|$ ($\frac{o(\rho^2)}{\rho^2} \xrightarrow{\rho \rightarrow 0} 0$)

$$f(x, y) = f(x_0, y_0) + \underbrace{(h\partial_x + k\partial_y) f(x_0, y_0)}_{\rightarrow \nabla f(x_0, y_0) \cdot (h, k)} + \frac{1}{2!} (h\partial_x + k\partial_y)^2 f(x_0, y_0) \\ + o(\rho^2)$$

$$= f(x_0, y_0) + \nabla f(x_0, y_0) \cdot (h, k) + \frac{1}{2!} (h, k) H \cdot \begin{pmatrix} h \\ k \end{pmatrix} + o(\rho^2)$$

$$H = \begin{pmatrix} f_{xx}(x_0, y_0) & f_{xy}(x_0, y_0) \\ f_{xy}(x_0, y_0) & f_{yy}(x_0, y_0) \end{pmatrix} \text{ ——— Hesse 矩阵, 实对称矩阵}$$

§15.5. 极值.

定义 5.1. 设 $f(x, y)$ 在 $P_0(x_0, y_0)$ 的某邻域 $O(P_0, r)$ 中有定义.

如果 $\forall P(x, y) \in O(P_0, r)$, 都有 $f(x, y) \geq f(x_0, y_0)$, 即 $f(x, y)$ 在 $P_0(x_0, y_0)$ 取极小值, $f(x_0, y_0)$ 称为极小值, $P_0(x_0, y_0)$ 称为 $f(x, y)$ 的极小值点.

如果 $\forall P(x, y) \in O(P_0, r)$, 都有 $f(x, y) \leq f(x_0, y_0)$, 即 $f(x, y)$ 在 $P_0(x_0, y_0)$ 取极大值, $f(x_0, y_0)$ 称为极大值, $P_0(x_0, y_0)$ 称为 $f(x, y)$ 的极大值点.

极大值、极小值统称为极值.

极大值点、极小值点统称为极值点. (critical point)

极大值

$$f(P) \leq f(P_0) \quad \forall P \in O(P_0, r)$$

若 $\forall P \in E, f(P) \leq f(P_0)$, $f(P_0)$: “最大值”

“极值” ——— “局部”.

定理 5.2 设 $f(x, y)$ 在 $P_0(x_0, y_0)$ 可微 在 $P_0(x_0, y_0)$ 取极值.

$$\text{则 } \nabla f(x_0, y_0) = \{f_x(x_0, y_0), f_y(x_0, y_0)\} = \{0, 0\}.$$

证明: 设 $f(x, y)$ 在 $P_0(x_0, y_0)$ 取极大值. 则

$$\forall P(x, y) \in O(P_0, r): f(x, y) \leq f(x_0, y_0).$$

$$y=y_0 \text{ 固定: } f(x, y_0) \leq f(x_0, y_0), \\ \forall |x-x_0| < r$$

$$f(x, y_0) \text{ 在 } x_0 \text{ 取极大值: 可导,} \\ \Rightarrow \frac{d}{dx} f(x, y_0) \Big|_{x_0} = 0: \text{ 即 } f_x(x_0, y_0) = 0.$$

$$(2) \text{ 同理: } f_y(x_0, y_0) = 0. \quad \#$$

$$f(x, y) \text{ 可微: } P_0(x_0, y_0) \text{ 是极值点: } \Rightarrow f_x(x_0, y_0) = 0, f_y(x_0, y_0) = 0$$

$$\text{例: } z = f(x, y) = \sqrt{x^2 + y^2}, \quad P_0(x_0, y_0) = (0, 0).$$

$$f(x, y) \geq 0 = f(0, 0); \quad \forall (x, y).$$

$$\Rightarrow f(x, y) \text{ 在 } (0, 0) \text{ 取极小值,}$$

$$\text{但: } f(x, 0) = \sqrt{x^2} = |x| \text{ 在 } x_0 = 0 \text{ 不可导}$$

$$\text{即 } f(x, y) \text{ 在 } (0, 0) \text{ 偏导数不存在.}$$

$$f(x, y) \text{ 在 } P_0(x_0, y_0) \text{ 取极值: } \begin{cases} f(x, y) \text{ 在 } P_0 \text{ 偏导数不存在, 或} \\ f(x, y) \text{ 在 } P_0 \text{ 偏导数存在} \Rightarrow \nabla f(P_0) = 0 \end{cases}$$

$$f(x, y) \text{ 在 } P_0(x_0, y_0) \text{ 有偏导数, } \nabla f(x_0, y_0) = \{f_x(x_0, y_0), f_y(x_0, y_0)\} = \vec{0}:$$

$$\text{称 } P_0(x_0, y_0) \text{ 是 } f(x, y) \text{ 之驻点 (临界点 critical point)}$$

$$\text{例 } z = f(x, y) = -x^2 + y^2:$$

—— 双曲抛物面, 马鞍面,

在 $P_0(0,0)$:

$$f_x(P_0) = -2x|_{x=0} = 0; \quad f_y(P_0) = 2y|_{y=0} = 0.$$

$$\nabla f(P_0) = \vec{0}; \quad P_0(0,0) \text{ 是临界点};$$

$$(x=0, y \neq 0): f(x,y) = -x^2 + y^2 = y^2 > 0 = f(0,0)$$

$$(x \neq 0, y=0): f(x,y) = -x^2 + y^2 = -x^2 < 0 = f(0,0)$$

$(0,0)$: x 是极值点. ——— 称为鞍点.

一元函数: $f(x)$ 在 x_0 处 $f'(x_0) = 0$

$$f(x) = f(x_0) + \cancel{f'(x_0)(x-x_0)} + \frac{1}{2!} f''(x_0)(x-x_0)^2 + o((x-x_0)^2)$$

$$= \underbrace{f(x_0)}_{\text{固定}} + \frac{1}{2} f''(x_0)(x-x_0)^2 + o((x-x_0)^2)$$

$$\downarrow \text{若正, } x \neq x_0: \frac{1}{2} f''(x_0)(x-x_0)^2 > 0$$

$$\downarrow f(x) > f(x_0) \quad (x \neq x_0)$$

$$\Rightarrow f(x_0) \text{ 是极小值};$$

$$\frac{1}{2} f''(x_0)(x-x_0)^2 < 0$$

$$\downarrow f(x) < f(x_0) \Rightarrow f(x_0) \text{ 是极大值}.$$

二元函数情形:

定理 5.3. 设 $f(x,y)$ 在 $P_0(x_0,y_0)$ 处可微, $P_0(x_0,y_0)$ 是临界点, 即

$$f_x(x_0,y_0) = 0, \quad f_y(x_0,y_0) = 0;$$

$$A = f_{xx}(x_0,y_0), \quad B = f_{xy}(x_0,y_0), \quad C = f_{yy}(x_0,y_0)$$

$H = \begin{pmatrix} A & B \\ B & C \end{pmatrix}$ 是 $f(x, y)$ 在 $P_0(x_0, y_0)$ 的 Hesse 矩阵.

① 若 H 是正定的, 则 $f(x, y)$ 在 $P_0(x_0, y_0)$ 取极小值,

② 若 H 是负定的, 则 $f(x, y)$ 在 $P_0(x_0, y_0)$ 取极大值,

③ 若 H 是不定的, 则 $f(x, y)$ 在 $P_0(x_0, y_0)$ 不取极值.

④ 若 H 是半定的, 则 不确定!

证明: $\because f(x, y)$ 有连续二阶偏导数, 由 Taylor 公式:

$$h = x - x_0, \quad k = y - y_0.$$

$$f(x, y) = f(x_0, y_0) + \nabla f(x_0, y_0) \cdot (h, k) + \frac{1}{2!} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix} + o(p^2).$$

$$\because P_0(x_0, y_0) \text{ 是 } f \text{ 的临界点: } \nabla f(x_0, y_0) = \vec{0},$$

$$f(x, y) = f(x_0, y_0) + \frac{1}{2} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix} + o(p^2).$$

①: 若 H 是正定的: $\Leftrightarrow H$ 有特征值 $\lambda_1, \lambda_2: 0 < \lambda_1 \leq \lambda_2$.

$$\Leftrightarrow \frac{1}{2} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix} \geq \frac{1}{2} \lambda_1 (h^2 + k^2) = \frac{1}{2} \lambda_1 p^2, \quad \lambda_1 > 0$$

$$p = \sqrt{h^2 + k^2} \rightarrow 0: \quad \frac{o(p^2)}{p^2} \rightarrow 0:$$

$$\forall \varepsilon \triangleq \frac{1}{4} \lambda_1 > 0 \quad \exists \rho_0 > 0: \quad \forall 0 < p < \rho_0: \quad \left| \frac{o(p^2)}{p^2} \right| < \varepsilon = \frac{1}{4} \lambda_1.$$

$$\left| \frac{o(p^2)}{p^2} \right| < \varepsilon = \frac{1}{4} \lambda_1, \quad |o(p^2)| < \frac{1}{4} \lambda_1 p^2.$$

$$\forall p = \sqrt{h^2 + k^2} < \rho_0: \Leftrightarrow (\forall (x, y) \in O(\rho_0, \rho_0)).$$

$$\begin{aligned}
 f(x, y) &= f(x_0, y_0) + \underbrace{\frac{1}{2} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix}}_{\substack{= \frac{1}{2} \lambda_1 \rho^2 - \frac{1}{4} \lambda_1 \rho^2 \\ = \frac{1}{4} \lambda_1 \rho^2}} + o(\rho^2) \\
 &\geq f(x_0, y_0) + \frac{1}{2} \lambda_1 \rho^2 - \frac{1}{4} \lambda_1 \rho^2 \quad o(\rho^2) > -\frac{1}{4} \lambda_1 \rho^2 \\
 &= f(x_0, y_0) + \frac{1}{4} \lambda_1 \rho^2 \quad (\lambda_1 > 0) \\
 &\geq f(x_0, y_0)
 \end{aligned}$$

$\therefore f(x_0, y_0)$ 是极小值.

② 若 H 是负定. (2) 则可证 $f(x, y)$ 在 (x_0, y_0) 取极大值
($\because$ 考虑 $-f(x, y)$ 即可).

③ H 是不定: $\iff H$ 的两个特征值 λ_1, λ_2 异号:
 $\lambda_1 < 0 < \lambda_2$.

$$\begin{aligned}
 \exists \text{ 单位特征向量 } (h, k) = (\xi_1, \eta_1) \neq \vec{0}: H \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} &= \lambda_1 \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} \\
 (\xi_1, \eta_1) \cdot H \cdot \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} &= (\xi_1, \eta_1) \cdot \lambda_1 \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} = \lambda_1 (\underbrace{\xi_1^2 + \eta_1^2}_{=1}) = \lambda_1 < 0
 \end{aligned}$$

$$(x, y) = (x_0, y_0) + (h, k), \quad (h, k) = t(\xi_1, \eta_1), \quad (t < 0)$$

$$\begin{aligned}
 f(x, y) &= f(x_0, y_0) + \underbrace{\frac{1}{2} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix}}_{\substack{= \frac{1}{2} t(\xi_1, \eta_1) H t \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} \\ = \frac{1}{2} \lambda_1 t^2}} + o(\rho^2) \quad \rho = \|(h, k)\| = |t| \\
 &= f(x_0, y_0) + \frac{1}{2} t(\xi_1, \eta_1) H t \begin{pmatrix} \xi_1 \\ \eta_1 \end{pmatrix} + o(t^2) \\
 &= f(x_0, y_0) + \underbrace{\frac{1}{2} \lambda_1 t^2}_{< 0} + o(t^2) \\
 &< f(x_0, y_0) \quad t \text{ 足够小.}
 \end{aligned}$$

对 $\lambda_2 > 0$, 相应的单位特征向量 (ξ_2, η_2) : 有

$$\xi_2^2 + \eta_2^2 = 1, \quad H \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} = \lambda_2 \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix}.$$

$$(\xi_2, \eta_2) \cdot H \cdot \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} = (\xi_2, \eta_2) \lambda_2 \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} = \lambda_2 (\xi_2^2 + \eta_2^2) = \lambda_2 > 0$$

$$\text{对 } (x, y) = (x_0, y_0) + (h, k)$$

$$(h, k) = t \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} \quad \text{单位向量,} \quad \rho = \|(h, k)\| = |t|.$$

$$f(x, y) = f(x_0, y_0) + \frac{1}{2} (h, k) \cdot H \cdot \begin{pmatrix} h \\ k \end{pmatrix} + o(\rho^2)$$

$$= f(x_0, y_0) + \frac{1}{2} t \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} H \begin{pmatrix} \xi_2 \\ \eta_2 \end{pmatrix} t + o(t^2)$$

$$= f(x_0, y_0) + \frac{1}{2} t^2 \lambda_2 + o(t^2) > 0$$

$$> f(x_0, y_0)$$

$f(x, y) > f(x_0, y_0) \quad \therefore f(x, y)$ 在 (x_0, y_0) 不取极值!

④ H 是半定 $\begin{cases} \text{半正定,} \\ \text{半负定,} \end{cases} \Rightarrow \text{不确定.}$

例. $f(x, y) = \pm(x^4 + y^4)$: 在 $P_0(x_0, y_0) = (0, 0)$:

$$\nabla f(x, y) = \{4x^3, 4y^3\} \Big|_{(0,0)} = \vec{0}.$$

$$A = f_{xx} = \pm 12x^2 \Big|_{P_0} = 0 \quad B = f_{xy} = 0;$$

$$C = f_{yy} = \pm 12y^2 \Big|_{P_0} = 0$$

在 $P_0(0,0)$: $H = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} = 0$: 不定:

若 $f(x,y) = x^4 + y^4 \geq 0 = f(0,0)$: $(0,0)$ 是极小值点.

若 $f(x,y) = -(x^4 + y^4)$: $(0,0)$ 是极大值点.

若: $f(x,y) = x^4 - y^4$: $\nabla f(0,0) = \{0, 0\}$.

$H = 0$, 但: $(0,0)$ 不是极值点.

$H = \begin{pmatrix} A & B \\ B & C \end{pmatrix}$: Hesse 矩阵.

$A = f_{xx}(x_0, y_0)$, $B = f_{xy}(x_0, y_0)$, $C = f_{yy}(x_0, y_0)$.

H 正定 $\Leftrightarrow H$ 的特征值 λ_1, λ_2 均正:

$$\begin{aligned} |\lambda I - H| &= \begin{vmatrix} \lambda - A & -B \\ -B & \lambda - C \end{vmatrix} = \underline{(\lambda - A)(\lambda - C) - (-B)^2} \\ &= \lambda^2 - (A + C)\lambda + (AC - B^2) = 0 \end{aligned}$$

$$\Rightarrow \begin{cases} \lambda_1 + \lambda_2 = A + C > 0 \\ \underline{\lambda_1 \cdot \lambda_2} = AC - B^2 > 0 \Rightarrow AC > B^2 \geq 0, \end{cases}$$

A, C 同号且 $A + C > 0$.

$$\Rightarrow \begin{cases} A, C > 0 \\ AC > B^2 \end{cases} \quad \curvearrowright$$

$H = \begin{pmatrix} A & B \\ B & C \end{pmatrix}$: 正定 $\Leftrightarrow$ 顺序主子式 > 0

$$\Leftrightarrow A > 0 \text{ 且 } AC - B^2 > 0$$

- 定理 5.4.
- ① 若 $A, C > 0$ 且 $AC - B^2 > 0$,
则 $f(x, y)$ 在 (x_0, y_0) 取极小值;
 - ② $A, C < 0$ 且 $AC - B^2 > 0$
则 $f(x, y)$ 在 (x_0, y_0) 取极大值;
 - ③ $AC - B^2 < 0$:
则 $f(x, y)$ 在 (x_0, y_0) 不取极值!
 - ④ $AC - B^2 = 0$: 不确定.

作业

P. 143. 1. (1) (3) (5) 2, 3, 4.
