| R_{1212} 怎么算?

有两种算法，取决于你手里有什么。

| 1. 如果已经有第二基本形式

最简单：

$$R_{1212} = b_{11}b_{22} - b_{12}^2$$

因为：

$$b_{11} = L, \quad b_{12} = M, \quad b_{22} = N$$

所以：

$$R_{1212} = LN - M^2$$

这就是 **Gauss 方程** 在二维曲面里的形式。

进一步：

$$K = \frac{LN - M^2}{EG - F^2}$$

所以：

$$R_{1212} = K(EG - F^2)$$

| 2. 如果只用第一基本形式算

如果你只知道：

$$I = E du^2 + 2F du dv + G dv^2$$

那就要通过 Christoffel 记号算。

先记：

$$g_{11} = E, \quad g_{12} = F, \quad g_{22} = G$$

曲率张量分量：

$$R_{1212} = g_{2\mu} R_{112}^{\mu}$$

因为 $\mu = 1, 2$ ，所以：

$$R_{1212} = g_{21} R_{112}^1 + g_{22} R_{112}^2$$

也就是：

$$R_{1212} = F R_{112}^1 + G R_{112}^2$$

| 3. R_{112}^{μ} 怎么算？

用公式：

$$R_{\alpha\beta\gamma}^{\mu} = \frac{\partial \Gamma_{\alpha\beta}^{\mu}}{\partial u^{\gamma}} - \frac{\partial \Gamma_{\alpha\gamma}^{\mu}}{\partial u^{\beta}} + \Gamma_{\alpha\beta}^{\eta} \Gamma_{\eta\gamma}^{\mu} - \Gamma_{\alpha\gamma}^{\eta} \Gamma_{\eta\beta}^{\mu}$$

现在取：

$$\alpha = 1, \quad \beta = 1, \quad \gamma = 2$$

得到：

$$R_{112}^{\mu} = \frac{\partial \Gamma_{11}^{\mu}}{\partial u^2} - \frac{\partial \Gamma_{12}^{\mu}}{\partial u^1} + \Gamma_{11}^{\eta} \Gamma_{\eta 2}^{\mu} - \Gamma_{12}^{\eta} \Gamma_{\eta 1}^{\mu}$$

因为 η 重复，所以对 $\eta = 1, 2$ 求和。

| 4. 展开成 u, v

记：

$$u^1 = u, \quad u^2 = v$$

所以：

$$\partial_1 = \frac{\partial}{\partial u}, \quad \partial_2 = \frac{\partial}{\partial v}$$

先算 R_{112}^1

$$R_{112}^1 = \partial_2 \Gamma_{11}^1 - \partial_1 \Gamma_{12}^1 + \Gamma_{11}^\eta \Gamma_{\eta 2}^1 - \Gamma_{12}^\eta \Gamma_{\eta 1}^1$$

展开 $\eta = 1, 2$ ：

$$R_{112}^1 = (\Gamma_{11}^1)_v - (\Gamma_{12}^1)_u + \Gamma_{11}^1 \Gamma_{12}^1 + \Gamma_{11}^2 \Gamma_{22}^1 - \Gamma_{12}^1 \Gamma_{11}^1 - \Gamma_{12}^2 \Gamma_{21}^1$$

前后两项抵消：

$$\Gamma_{11}^1 \Gamma_{12}^1 - \Gamma_{12}^1 \Gamma_{11}^1 = 0$$

又因为：

$$\Gamma_{21}^1 = \Gamma_{12}^1$$

所以：

$$R_{112}^1 = (\Gamma_{11}^1)_v - (\Gamma_{12}^1)_u + \Gamma_{11}^2 \Gamma_{22}^1 - \Gamma_{12}^2 \Gamma_{12}^1$$

再算 R_{112}^2

$$R_{112}^2 = \partial_2 \Gamma_{11}^2 - \partial_1 \Gamma_{12}^2 + \Gamma_{11}^\eta \Gamma_{\eta 2}^2 - \Gamma_{12}^\eta \Gamma_{\eta 1}^2$$

展开：

$$R_{112}^2 = (\Gamma_{11}^2)_v - (\Gamma_{12}^2)_u + \Gamma_{11}^1 \Gamma_{12}^2 + \Gamma_{11}^2 \Gamma_{22}^2 - \Gamma_{12}^1 \Gamma_{11}^2 - \Gamma_{12}^2 \Gamma_{21}^2$$

由于：

$$\Gamma_{21}^2 = \Gamma_{12}^2$$

所以：

$$R_{112}^2 = (\Gamma_{11}^2)_v - (\Gamma_{12}^2)_u + \Gamma_{11}^1 \Gamma_{12}^2 + \Gamma_{11}^2 \Gamma_{22}^2 - \Gamma_{12}^1 \Gamma_{11}^2 - (\Gamma_{12}^2)^2$$

| 5. 最终公式

因此：

$$R_{1212} = FR_{112}^1 + GR_{112}^2$$

其中：

$$R_{112}^1 = (\Gamma_{11}^1)_v - (\Gamma_{12}^1)_u + \Gamma_{11}^2 \Gamma_{22}^1 - \Gamma_{12}^2 \Gamma_{12}^1$$

$$R_{112}^2 = (\Gamma_{11}^2)_v - (\Gamma_{12}^2)_u + \Gamma_{11}^1 \Gamma_{12}^2 + \Gamma_{11}^2 \Gamma_{22}^2 - \Gamma_{12}^1 \Gamma_{11}^2 - (\Gamma_{12}^2)^2$$

| 6. 但是考试最常用的是这个

如果题目已经给了：

$$E, F, G, L, M, N$$

或者已经让你算出第一、第二基本形式，那直接用：

$$R_{1212} = LN - M^2$$

然后：

$$K = \frac{R_{1212}}{EG - F^2}$$

也就是：

$$K = \frac{LN - M^2}{EG - F^2}$$

| 7. 最短记忆

有 L, M, N ：

$$R_{1212} = LN - M^2。$$

只有 E, F, G ：

$$\text{先算 } \Gamma, \text{ 再算 } R_{112}^{\mu}, \text{ 最后 } R_{1212} = F R_{112}^1 + G R_{112}^2。$$

最后：

$$K = R_{1212} / (EG - F^2)。$$

一般期末里，最常见的有效路线是：

$$E, F, G, L, M, N \Rightarrow R_{1212} = LN - M^2 \Rightarrow K = \frac{LN - M^2}{EG - F^2}$$
